

Rely on Protection. Advance with Ease.

The **EZ-Advancer® Closed System Intermittent Catheter** takes the standard touchless, self-contained catheter further with an innovative, patented solution to help enable quicker and more efficient catheter advancement. Experience the difference and get back to what matters most to you.

Advance with Confidence

On average, intermittent catheterization is performed 4-6 times per day or every 4-6 hours.¹ A hygienic and efficient process is essential for every bladder management plan. The EZ-Advancer design incorporates features to help reduce the risk of recurrent urinary tract infections (UTIs) while simplifying handling and ease of use.

- The soft silicone, **pre-lubricated introducer tip** available in straight and coude, protects the catheter and bypasses bacteria in the distal urethra to help reduce the risk of UTIs.
- The **patented EZ-Advancer® valve** secures the catheter after each forward movement, preventing retraction into the bag.

The catheter is self-contained within a collection bag – providing touchless use to protect the sterility of the catheter.
